ARPG POV Installation Guide

Made for Vortex Mod Manager. Tested on Skyrim SE 1.7.104.

ARPG POV adds an **ARPG camera angle**, **point and click** and an **ARPG style HUD** to Skyrim. GitHub · Nexus

Video guide: (In Progress)

> **Easiest install: the ARPG POV Nexus Collection.** It's the full Diablo-style modpack, and one click in Vortex installs ARPG POV, its requirements and everything in the table below. After it finishes, do Step 2 and Step 3.

> **Note: ALL SETTINGS ARE VERY CUSTOMIZABLE.** Press **F1** in game, then go to **ARPG POV**. Every feature can be switched on or off and tuned there, live. The defaults are my picks for the collection. Don't want the globes? Turn them off under **F1 → HUD**.

Before you start

- **Skyrim SE 1.7.104.** To check your version, right-click `SkyrimSE.exe` → **Properties** → **Details**. **File version** should read 1.7.104.
- **Vortex** is installed and managing Skyrim Special Edition.
- **Your game folder** is the folder with `SkyrimSE.exe` in it. In Steam, right-click Skyrim Special Edition → **Manage** → **Browse local files**. The usual location is `C:\Program Files (x86)\Steam\steamapps\common\Skyrim Special Edition\`, and the `Data` folder is inside it.

What's in the collection

	Mods
Required	SKSE, Address Library, SKSE Menu Framework, True Directional Movement, Pandora Behaviour Engine
Base	ARPG POV, SkyUI, MCM Helper, Alternate Start - Live Another Life

	Mods
Camera	Some Collision Camera, Motion Sensitive Fix
Combat	Precision
Skills and spells	Ordinator, Apocalypse, Summermyst
Loot	DiabloRim, Socketing DiabloRim needs Grid Inventory and EPW4NPCs, and Nexus lists both when you download it. Install Grid Inventory first and let DiabloRim overwrite it.
Crash reports	Crash Logger SSE

Step 1: Download Skyrim, mods and dependencies

Using the collection: add it to Vortex from its Nexus page, let Vortex install everything, then go to Step 2.

Installing by hand:

1. **SKSE.** Download the build for runtime 1.7.104 [FILL: SKSE version] from skse.silverlock.org. It isn't on Nexus. Following its readme, copy `skse64_loader.exe` and the `.dll` files into your game folder, next to `SkyrimSE.exe`.
2. **Everything else.** On each Nexus page in the **Required** row, plus ARPG POV, click **Mod Manager Download** so Vortex installs it. For Address Library, pick [FILL: which file].
3. In Vortex's **Mods** tab, make sure each mod is **Enabled**, then **Deploy**.
4. **If you use 3PCO - 3rd Person Camera Overhaul, turn it off.** ARPG POV handles the camera itself.

Step 2: Launch Pandora's .exe and load the TDM files through Vortex

1. In Vortex, go to **Dashboard → Tools → Add Tool** and browse to Pandora's .exe [FILL: where Vortex puts it].
2. Launch Pandora from the Dashboard.
3. Tick the TDM patches [FILL: exactly what to tick] and run it.
4. Close Pandora, then **Deploy** in Vortex if it asks.

5. Run Pandora again whenever you add or remove behaviour mods (Precision and similar).

Step 3: Launch the game and configure settings

Launch with **SKSE** from the Vortex Dashboard (`skse64_loader.exe`), not Steam's Play button.

> **Configure TDM first.** The camera won't work properly until TDM is set up.

True Directional Movement

Option A, fastest: use my settings file.

1. Close Skyrim.
2. Download TrueDirectionalMovement.ini (on GitHub, use **Download raw file**).
3. Drop it into `<game folder>\Data\MCM\Settings\`. On a default Steam install, that's `C:\Program Files (x86)\Steam\steamapps\common\Skyrim Special Edition\Data\MCM\Settings\TrueDirectionalMovement.ini`.
4. If the `MCM` or `Settings` folder doesn't exist, create it. If the file is already there, replace it.

This sets the lock-on key to **Mouse 4**. If you don't have one, rebind **Toggle Target Lock Key** in TDM's MCM.

Option B: set it by hand in TDM's MCM.

TDM page → section	Option	Set to
Directional Movement → Directional Movement Settings	Directional Movement (Sheathed) / (Drawn)	Directional
Directional Movement → Directional Movement Settings	Auto Adjust Camera	Disable
Target Lock → Target Lock Settings	Auto Target Next	Off
Target Lock → Camera Settings	Camera Pitch Adjust Speed / Camera Yaw Adjust Speed	0.1 (minimum)

TDM page → section	Option	Set to
Target Lock → Camera Settings	Relaxed Screen Edge Margin	45 (maximum)
Target Lock → Controls	Reset Camera with Target Lock Button	Off
Target Lock → Controls	Reset Camera Pitch	Off
Target Lock → Controls	Toggle Target Lock Key	Any key (mine is Mouse 4)

DiabloRim inventory size

DiabloRim's board is 10×8 by default. My settings make it **10×40**, the most DiabloRim allows. Carry weight adds up to 5 more rows, and with ARPG POV's carry weight you get all 5, so it's 10×45. 14 rows show at once and the rest scroll.

1. Close Skyrim.
2. Download my GridInventory_ui.ini (on GitHub, use **Download raw file**).
3. Drop it into `<game folder>\Data\SKSE\Plugins\` and replace the existing file. On a default Steam install, that's `C:\Program Files (x86)\Steam\steamapps\common\Skyrim Special Edition\Data\SKSE\Plugins\GridInventory_ui.ini`.

The file also sets: **the game keeps running while the inventory is open** (`!nopause = 1`), the quick wheel off, and my Parchment Crimson skin and UI scale. It keeps your own window positions. Change any of these in DiabloRim's **Settings**.

To set the size yourself instead, change the `!basegrid = 10, 40` line in that file (columns, rows). Columns go from 4 to 24 and rows from 1 to 40.

All my settings files are in the GitHub repo.

Game controls

Keep left click bound to an attack (either hand). The plugin needs it there to see your clicks.

ARPG POV (F1)

Press **F1** and make it yours. Changes apply live. Click **Save to INI** to keep them.

F1 page	Changes
Camera	Preset (Default, plus Path of Exile 2, Path of Exile, Diablo II–IV, Last Epoch, Grim Dawn, Torchlight II, Skyrim ARPG, Custom), pitch, distance, FOV
Cutaway	On/off, Default or Automatic style, cut height
Controls	Point and click, cursor, click behaviour, hold to attack, auto-attack
Outlines	Who glows, ground circles, glow strength, distances
Labels and Loot	Labels and the loot filter
HUD	Globes on/off, vanilla bars, size, numbers
Player	Carry weight and speed

First-launch checklist

- [ ] The camera is top-down at 30°.
- [ ] A cursor is on screen, and left clicking the ground walks you there.
- [ ] The life and mana globes are in the bottom corners.
- [ ] **F1** shows an **ARPG POV** section.
- [ ] Inside a building, the walls and roof above you are cut away.
- [ ] Locking on with your TDM key doesn't swing the camera behind you.

If you see *"ARPG POV: point and click needs SKSE Menu Framework"*, SKSE Menu Framework isn't loading.

Keys

Key	Does
Left click	Move, attack, loot, talk, use doors
Shift + left click	Attack in place
Hold attack (+ Left Alt)	Keep attacking (power attack)

Key	Does
Middle mouse	Use things without moving or attacking
F1 / F7 / F8	Settings / point and click on-off / reload INI
F9 / F10	Cutaway style / camera lock on-off
Page Up / Page Down	Camera pitch

Common problems

Problem	Fix
Nothing changes	Launch through SKSE. Check that SKSE and Address Library match 1.7.104.
No cursor or F1 menu	Install SKSE Menu Framework.
Camera fights you or swings behind you	Turn off 3PCO - 3rd Person Camera Overhaul and recheck TDM (Step 3).
TDM settings didn't apply	Check the file path: it must be `Data\MCM\Settings\TrueDirectionalMovement.ini`, with Skyrim closed while you copy it.
Left click does nothing	Bind it to an attack, then press F7.
Clicks land on chairs	F1 → Controls: untick furniture and activators.
Low FPS in crowds	F1 → Outlines: lower the distances.
Crash indoors	Press F9 for the Default style, then send a crash log.
Settings gone after an update	Back up `Data\SKSE\Plugins\ARPGPOV.ini` before updating.
Inventory is only 10×8 / "Out of space"	Use my GridInventory_ui.ini, or set !basegrid = 10, 40 in Data\SKSE\Plugins\GridInventory_ui.ini with Skyrim closed (Step 3).

Crash logs: send the newest `crash-<date>.log` (from Crash Logger SSE) and `ARPGPOV.log` from `Documents\My Games\Skyrim Special Edition\SKSE\`, with where it happened. Use the Nexus Bugs tab, GitHub issues, Discord **nannernick** or Twitter **@nannernickCS**.

Uninstall

Speed and carry weight are stored in your save. Set Speed mult to 100 and Carry weight back in F1 → Player, click **Apply now**, and save. Then remove the mod in Vortex and deploy. There is no ESP.
